

System test engineer will be primarily be responsible for system level feature testing, developing/executing test strategies and test plans, field log analysis, troubleshooting/analyzing problems, optimizing system performance, improving the stability of the product, testing and optimizing power consumption and supporting customers with product commercialization.

Candidate will be working with a multi-discipline team (Software Development, System Design, Customer Support, ASIC Design, RF Circuits and Hardware Design, etc.) to integrate, test and commercialize QCT products. Automation framework development and maintenance along with new feature integration is also an expectation of the position.

Applicants should be motivated to learn, eager to debug and resolve issues, have a customer mindset, and be interested in wireless technologies. They should be able to transfer high level requirements into test designs, be familiar with accepted engineering practices, and be able to work independently as well as part of a larger team.

Responsibilities:

- Develop good understanding of Radio Access Technologies- 5G/LTE/UMTS/GERAN/ CDMA2000, 1xEV-DO and call flows for Single SIM and Multi-SIM devices
- Develop understanding of Physical layer, MAC procedures, Radio Resource Control protocol specifications, Non-Access Stratum procedures and data protocol stacks
- Candidate will be responsible for verifying Modem software protocols/features, characterizing system performance, Software stability and Power Consumption testing
- Develop expertise in using Network Simulators for preparing test beds, configuration, scripting and debugging
